                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel enzyme of starch biosynthetic pathway in a cereal plant, where the enzyme is selected from starch branching enzyme (BBE) I, SBE II, starch soluble synthase (SSS) I, and debranching enzyme (DBE), with the proviso that the enzyme is not SSS I of rice, or SBE I of rice or maize. The methods and products can be used for targeting expression specifically to the endosperm of the seeds of cereal plants such as wheat or barley. They can be used for the expression of e.g. antisense sequences of granule-bound synthase (GBSS), SBE II, low mol. wt. glutenin, grain softness protein I, bacterial isoamylase, bacterial glycogen synthase, and wheat high mol. wt. glutenin BxI7. They can be used for modifying the characteristics of starch produced by a clarat make the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9510

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     10230
                                                The present sequence encodes a wheat starch branching enzyme of Aegilops tauschii, designated F2. A. tauschii is likely to be the ancestral D genome donor of wheat. Probes isolated from the presen sequence were used to identify type II starch branching enzymes (S in wheat, especially BEIIb. The BEIIb nucleic acids may be used to genetically transform cereal plants such as wheat or barley and fo altering their nutritional content by modulating the starch biosynthetic pathway to vary levels of amylopectin and/or amylose produced in the plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            10290

The specification describes BEIIb. BEIIb is a type II starch branching enzyme (SBE). The BEIIb nucleic acids me be used to genetically transform cereal plants such as wheat or barley and for altering their nutritional content by modulating the starch biosynthetic pathway to vary levels of amylopectin an amylose produced in the plant.

The specification also describes subclass SBEII-1 genes, which are thought to have similar functional properties to the maize SBEII gene. Starch branching enzymes catalyse the formation of the alpha-1,6 linkages, creating branch points in the growing starch molecule, via hydrolysis of an alpha-1,4 linkage followed by reattachment of the released alpha-1,4-glucan chain to the same or another glucosyl chain. SBEII polypeptides can be used to alter the characteristics of a plant, in particular to alter starch so that it has an elevated gelatinisation onset and/or peak temperature. Starch obtained from transgenic plants is useful in the preparation or

```
The present sequence represents a clone of wheat starch branching enzyme II (SBEII), which is part of a novel subclass of known SBEII genes, designated SBEII-1. The specification also describes subclass SBEII-2 sequences. The SBEII-1 genes are thought to have similar functional properties to the maize SBEIID gene. Starch branching enzymes catalyse the formation of the alpha-1,6 linkages, creating branch points in the growing starch molecule, via hydrolysis of an alpha-1,4 linkage followed by reattachment of the released alpha-1,4-glucan chain to the same or another glucosyl chain. SBEII polypeptides can be used to alter the characteristics of a plant, in particular to alter starch so that it has an elevated gelatinisation onset and/or peak temperature. Starch obtained from transgenic plants is useful in the preparation or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   functional properties to the maize SBEIIb gene. Starch branching enzymes catalyse the formation of the alpha-1,6 linkages, creating branch points in the growing starch molecule, via hydrolysis of an alpha-1,4 linkage followed by reattachment of the released alpha-1,4-glucan chain to the same or another glucosyl chain. SBEII polypeptides can be used to alter the characteristics of a plant, in particular to alter starch so that it has an elevated gelatinisation onset and/or peak temperature. Starch obtained from transgenic plants is useful in the preparation or processing a foodstuff, particularly bakery products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The

The specification describes novel subclasses of SBEII, designated SBEII-1 and SBEII-2. The SBEII-1 genes are thought to have similar functional properties to the maize SBEIIb gene. Starch branching enzymes catalyse the formation of the alpha-1,6 linkages, creating branch points in the growing starch molecule, via hydrolysis of an alpha-1,4 linkage followed by reattachment of the released alpha-1,4-glucan chain to the same or another glucosyl chain. SBEII polypeptides can be used to alter the characteristics of a plant, in particular to alter starch so that it has an elevated gelatinisation onset and/or peak temperature. Starch obtained from transgenic plants is useful in the preparation or processing a foodstuff, particularly bakery products.
Transgenic corn in which grain derived starch fine structure is controlled - specifically branch chain distribution of amylopec useful in preparation of thickened foodstuff

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             fragment of corn starch branching enzyme IIb (SBEIIb) cDNA (see also ART69729), starting at the initiating ARG codon of the coding region and terminating 312 bp 5' of the translation termination codon. It was obtd. by site-specific mutagenesis of the SBEIIb gene in plasmid pBE240 to generate an NcoI site at the ARG start site, and EcoRI digestion of the mutagenised plasmid. The 2.09 kb fragment was inserted, in sense orientation, between the zein promoter and 3' regions in vector pML103 to produce pBE96. Co-suppression and antisense techniques can be used to inhibit SBEIIb in transgenic plants and thereby alter starch properties.

         The specification describes a method for the production of non-glycogen-like polysaccharides in a host. The method comprises transforming a host, suitable for fermentation, with genes encoding starch or glycogen synthesis enzymes, and fermenting the transformants. The specification also describes hosts transformed with a gene active in glycogen synthesis and at least one non-starch branching gene,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               also AAT69729). It was generated by EcoRI digestion of plasmid pBE240 and was inserted into vector pML103 in antisense orienta with respect to a maize 27 kDa zein promoter and a 10 kDa zein 3' sequence. Transgenic corn plants expressing the near full-length SBEIID antisense transcript demonstrated a unique starch

A cDNA insert (AAT69729) in plasmid clone pBE240 comprises a EcoRI-XhoI fragment isolated from a corn cDNA library. It is an open reading frame encoding starch branching enzyme IIb (AAW19212). The insert was used as a starting point in the of DNA constructs (see also AAT69730, AAT69736-37) designed achieve suppression of SBEIIb expression in transgenic corn and thereby to produce novel starches that have properties beneficial in food and industrial applications.
                                                                                                                                                                                                                                                     Transgenic corn in which grain derived starch fine structure is controlled - specifically branch chain distribution of amylopectin, useful in preparation of thickened foodstuff
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1882
